Abstract: It is seldom that a reviewer can agree with the "commercial patter" on the jacket of a technical book, and far too often such advertisements can only give rise to cynical laughter when the book is read. This book can, however, be said to live up to the claim that it should be especially valuable to all who have to carry out routine biochemical tests, *i.e.*, to clinical pathologists, hospital biochemists, laboratory technicians, and to workers in university and other laboratories engaged in research where the determination of chemical constituents of body fluids is required. The author provides a comprehensive collection of those biochemical tests found most convenient for the hospital biochemist. In a few cases, more than one method is described.
