Abstract: This 3-volume work on the biology of insect eggs was at the early proof stage at the time of the death of the author, and the final stages of publication were completed by colleagues. It is the first comprehensive account of all aspects of the insect egg (excluding embryology, since this has been reviewed elsewhere). The work is profusely illustrated with line-drawings and electron micrographs. The first volume contains chapters on aspects of general interest, including egg morphology, enemies of eggs, and other topics relating to insects and their eggs.
