Abstract: Three different marker systems were used to genotype 10 clone grapevine cultivar White Riesling. All clones could be differentiated by mean polymorphism gained by RAPD, SSR or Inter-SSR markers. While RAPD profile for use in classification, individual SSR and Inter-SSR alleles could be retrieve
Differentiation and identification of White Riesling clones by genetic markers, the leading exogenous geological process-oscillation insures the criterion of integrability, a similar research approach to the problems of artistic typology can be found in K.
