Fluorides and human health.

Author(s): WORLD HEALTH ORGANIZATION.

Abstract: This monograph was prepared by 29 experts including Professor Y. Ericsson who acted as special consultant and scientific editor and wrote the introductory chapter. Other chapters are entitled: The supply of fluorine to man, Absorption of fluorides, Distribution of fluorides, Excretion of fluorides, Physiological effects of small doses of fluoride, Toxic effects of larger doses of fluoride, Fluorides and general health, Fluorides and dental health. As stated in the preface "The objective of the monograph is to provide an impartial review of the scientific literature on the varied aspects of fluoridation and the many complex questions relating to the metabolism of fluorides and their utilization in medicine and public health. It is not intended to be a practical guide..."
use of fluorides as a health measure, but rather a presentation of the facts to health authorities and other interested persons to form an objective judgment. The manuscript was first circulated to 93 specialists and to the six WHO Regional Offices and the comments obtained were considered so that the final version is as representative as possible of dental and medical opinion throughout the world.

The product, an authoritative and excellent review of the voluminous literature on the subject, should prove invaluable to workers in this field and particularly to public health authorities. Literature which may have given rise to fears that controlled ingestion of fluoride may cause skeletal fluorosis or interfere with kidney or thyroid function is considered thoroughly. The depth of the review may be gauged from the fact that included in the references are the well-known anti-fluoridation books: "The fluoridation experiment" by F. B. Exner and G. L. Waldbott (1957) and "The chemistry of fluorine, arch enemy of mankind" by L. Spira (1953). The last chapter of the monograph finishes with the following paragraph: "The outstanding ability of fluoride to prevent caries by mechanisms that are not yet fully understood warrants great efforts both in basic and applied research and in practical application of methods that can effectively be utilized for the attainment of improved dental health, which is part of human general health."--A. Hepburn.
