
Author(s): HEINRICH, H. W.

Abstract: This book, now in its second edition, is directed to industrial executives, personnel managers, and all those whose work brings them into contact with industry. It discusses the basic philosophy of accident prevention, the actual facts relating to accidents, the kinds of machinery, the psychology of safety, fatigue, occupational disease, the organization needed to prevent accidents, statistics and the various methods of educating employees.
The conclusion is summed up as follows. "When a situation exists that creates injury and suffering; when it costs a king's ransom annually, when its cure has been demonstrated to be practical; and when all are agreed that something can and should be done about it, it is time to stop talking, roll up the sleeves and go to work." The stage has been reached, all are agreed, yet there is still need for some talking and hence this book.

Although human failure in some form is the cause of many accidents yet even the accident-prone can have fewer accidents if the environment in which they work is reasonably safe. Since one way of ensuring this is to limit the dangerous nature of machines, there is a full and excellently illustrated chapter showing what can be done in designing and constructing tools so that guards are not required, in providing barricades and mechanical feeding devices, and devices that prevent or interrupt movements of tools when the operator's hands are in the danger zone, an remote-control operating mechanism.

Many unsafe practices are continued because they are often unrecognized. Therefore there should be a detailed study of the cause of each accident. Report forms are given which illustrate how the recording should be done. The more personal aspects, such as the importance of the attitude taken by management regarding accidents, and the need to educate foremen and workers, discussed in detail. The problem of the Jonathans, or in other words, the accident-prone, is treated practically, and its importance realized.

Appendices supply the relevant statistical information. The book is well written and style persuasive; it is an excellent survey of a difficult and complicated subject. Industrial medical officers as well as employers will find it very valuable. May Smith.
