Journal article: Lancet 1961 pp.313-15 ref.12

Abstract: Pigmented organisms belonging to the Cloaca group A were isolated from the brains of 2 infants dying within 2 days of each other in St. Albans City Hospital: the organisms were isolated also from the cerebrospinal fluid and bronchus in one infant, and from the bronchus, liver and marrow in the other. Both infants had made normal progress after birth, one for 10 days, the other for 5 before developing the rapidly fatal infection. The infants had not been in contact with each other except that an incubator used for the first child may have been used for the second child also a week later. Bacteria...
failed to find any pathogenic organisms in the incubator but showed that the aerosol infection was a possibility. One of the infants was a twin but the other showed no evidence of infection. A. B. Christie.
