Theology in the flesh - a model for theological anthropology as embodied sensing

Jacob Meiring

Department of Dogmatics and Christian Ethics, Faculty of Theology, University of Pretoria, South Africa

Correspondence

ABSTRACT

The author proposes a model for theological anthropology as embodied sensing that is based on an interdisciplinary exploration of the corporeal turn from a southern African perspective. The work of James B. Nelson is acknowledged, stating that body theology starts with the concrete, the bodily expressions of life and not with doctrines about God and humanity. The theological anthropology of David H. Kelsey is evaluated as a theological anthropology with a sentiment of the flesh. Based on clearings in the work of David Kelsey and an interdisciplinary research, the author proposes a model for theological anthropology as embodied sensing which functions within the intricate and complex connection of the living body.
and experiencing in a concrete lifeworld with an openness to the 'more than'. The author considers the use of bodymapping within narrative therapy as a way in which to uncover the intimate and intricate connection between body and language, and implementing insights from theological anthropology as embodied sensing.

Introduction

Artists in the 18th century had an obsession with the flesh. The challenge was to capture the colour of skin on canvas. The French philosopher and art critic, Dennis Diderot, writes in his Essay on Painting that the realism in a painting derives from and that life originates from colour, stating that:

"He who has acquired the feeling for flesh has progressed a lot; the rest is nothing in comparison. Thousand painters have died without knowing flesh; thousand others will die without feeling it." (Diderot 1795 cited in Rabaté 1996:34)

This was paraphrased in the 2010 film, Le sentiment de la chair [The sentiment of the flesh], with the remarks that 'a thousand painters died not knowing the sentiment of the flesh. Many more will die not knowing' (Smells like screen spirit 2011).

The quest in my research is for a theological anthropology that can reflect a deeper understanding of the dimensions of bodily life; a theological anthropology that has a sentiment of the flesh. In proposing a theological anthropology as embodied sensing, I have explored the corporeal turn from a southern African perspective in an interdisciplinary conversation with other disciplines like sociology, philosophy, somatic psychology, cognitive science and molecular biology, weaving them together with the voices of Church Fathers, Reformation, artists and novelists. A postfoundationalist theology opens the door very wide to an interdisciplinary dialogue, and especially in the context of initiating deeper and deeper levels of inquiry into the body and the experiences of the body within a specific and concrete lifeworld.

The body - a South African perspective

While the obsession in the 18th century was mostly with white skin, the morbid fascination in the 19th century was with black flesh; the beginning of an era of 'the new pseudo-science of ethnology' that went hand in hand with the economic exploitation of colonies, and scientific racism (Holmes 2007:70). The public exhibition on Piccadilly, London of 'The Hottentot Venus' was probably the most prominent body on display of a black woman (as colonial subject) in the 19th century and remained so till 1976 when her skeleton and body cast were removed from public display at the Museum of Natural History in Paris (Holmes 2007:65). Lahoucine Ouzgane (2002), a scholar in postcolonial theories, writes that this way of pathologising the black body through the process of 'othering' was done to elevate the European as superior and different to other races. White bodies were considered to be civilised and controlled, whereas black bodies were 'oversexed and savage'. To maintain the 'truth' of the structures and institutions of these colonial empires, black bodies were disciplined (including torture and death) and made docile. After the 19th century, 'this surveillance was an internal mechanism of docility' that was used by white people to determine what was possible for black bodies also for white bodies (Ouzgane 2002:244). It was a mission that was implemented also during apartheid brutality, force, arrogance, humiliation, and deep insensitivity.

A well-known attempt to clear society of the monstrosities of apartheid was made in the form of the Truth and Reconciliation Commission (TRC) under the chairmanship of Archbishop Desmond Tutu. The 'descriptions, representations and conflicts around bodies in various states of mutilation, dismemberment, and internment within the terror of the core' of the TRC (Bethlehem 2006:82). Family members repeatedly pleaded for the remains or body parts of their loved ones, 'making their visibility, recovery and repossession a metaphor for the settlement of the past of apartheid' (Bethlehem 2006:82). The 'moral signature' of the TRC was the employment of two visual 'tools', namely the practice of exhumation and experiencing in a concrete lifeworld with an openness to the 'more than'. The author considers the use of bodymapping within narrative therapy as a way in which to uncover the intimate and intricate connection between body and language, and implementing insights from theological anthropology as embodied sensing.
It formed the basis for the development of the theology of the body within Roman Catholic and Protestant churches.

The sociologist Didier Fassin (2007) writes that the body is not just a manifestation of a person’s presence in the world, but also a site where the past has left its mark or as he puts it:

> The body is a presence unto oneself and unto the world, embedded in a history that is both in collective: the trajectory of a life and the experience of a group. (p. 175)

Any contemporary theological anthropology in South Africa should have a profound consideration for the social and cultural changes of the 1960s, 1970s and early 1980s. The application of bodyscape therapies within somatic psychology were greatly influenced by the cultural changes of the 1960s.

The corporeal turn in theology and theological anthropology

Was there really something like a ‘corporeal turn’, a conceptual shift that happened some time during the 20th century? In her book, *The corporeal turn* (2009), Maxime Sheets-Johnstone writes that the humanities and human sciences were ‘the spawning grounds of two fundamental conceptual shifts in the twentieth century: the earlier linguistic turn and the phenomenological movement laid the foundation for the corporeal turn. In the late 1940s and 1950s, philosophers such as Maurice Merleau-Ponty, Gabriel Marcel and Michel Foucault put the body at the centre of the ontological problem and in this way, initiated the corporeal turn. The 1960s and 1970s were also the decades when the body in social life; in the 1980s, feminist theology, black theology, liberation theology, queer theory and the AIDS epidemic further impacted on the social regulation and construction of the bodies of women, black people, and of gay men and lesbian women. The application of bodyscape therapies within somatic psychology was greatly influenced by the cultural changes of the 1960s.

My own argument would be that one could refer in broad terms to the corporeal turn (1940-1965), followed by a second wave (1990-2000). Perhaps it would also be feasible to speak of second and third generation corporeal turns. The second generation corporeal turn appears to be a tentative application of the insights from philosophers in other disciplines such as sociology, psychology and theology. It also seems that it has an interdisciplinary scope. From research conducted within cognitive science, I note a 3rd generation corporeal turn. Once again, philosophy has set the pace with Eugene Gendlin, *Thinking beyond patterns: Body, language, and situations* (1991), George Lakoff and Mark Johnson, *Where language begins* (1999), and Horst Ruthrof, *The body in language* (2000).

The question can also be asked whether one can truly talk about a corporeal turn in theology in the same way that one refers to a convergence of the linguistic and corporeal turn, also as a result of cognitive linguistics with an emphasis on how language develops from the body, and the influence of metaphorical thinking. I would refer to this 3rd generation corporeal turn as a corporeal-linguistic turn. Once again, philosophy has set the pace with Eugene Gendlin, *Thinking beyond patterns: Body, language, and situations* (1991), George Lakoff and Mark Johnson, *Where language begins* (1999), and Horst Ruthrof, *The body in language* (2000).

The question can also be asked whether one can truly talk about a corporeal turn in theology within other academic disciplines, or is there another dynamic at play? What is clear at this point is that the body in theology has been influenced by the French phenomenological philosophers not only in theology, and especially in the development of a theology of the body within Roman Catholic theology.

Pope John Paul II wrote the manuscript, *Man and women He created them* in Polish in the 1970s when it formed the basis for the development of his theology of the body through his Wednesday catechism

Nelson’s (1978) work was influential in my quest for a theological anthropology that takes the body seriously. He repeats the assertion in his 1978 book that 'body theology begins with the concrete' and not with doctrines or creeds or problems in tradition. It begins with the concrete and 'the fleshly experience of life - with our hungers and our pass aliveness and deadness' (Nelson 1992:43). He considers 'lived experience' to be the most neglected in many, theology is a 'second moment' and that the first moment is 'life itself', that 'theology comes understand and serve life' (Nelson 2004:12).

\[
\text{The real you is none other than this living human body that has been born of particular parents at a particular time and place in a particular society with its particular culture. (p. 285)}
\]

He does not believe in the Fall or in the existence of a historic couple such as Adam and Eve. Kelsey is the overemphasis of 'the interior psychology of sin' as introduced into theology by Augustine through man. Instead, he appeals to humans to be wise in their practices in the way they interact with other humans, institutions and other non-human creatures.

Kelsey (2009:162) alludes to the 'textures of life' when he refers to the created proximate context as 'human's concrete everydayness', and the dignity that is inherent to this everydayness, where the perfect, real the 'ordinary everyday human person.' He alludes to the 'textures of a fleshly world' when he sees the 'inherently ambiguous' - filled with 'the possibility of our well-being' as humans and at the same time pain, loss and death (Kelsey 2009:202). He acknowledges this textured life when he anchors his theological anthropology in the doctrine of creation and in the practical wisdom of Job.

**A model for theological anthropology as embodied sensing**

Keeping in mind the limitations in the focus of body theology and theology of the body, as well as the theological anthropology of David Kelsey (a wider incorporation of the corporeal-linguistic turn from other theological anthropologies, and the recognition of bodily experience as a source of revelation), I propose a model (see Figure 1) for theological anthropology as embodied sensing (Meiring 2014:283).
A contemporary theological anthropology with a sentiment of the flesh and a sensitivity to the textures of life functions within the intricate and complex connection of the living body, language, and experiencing in a concrete lifeworld. The model can express a variety of ideas and concepts, expressing amongst others the notion of eccentric Trinitarian theological anthropology of David Kelsey. The word 'sensing' is an effort to move away from the subject distinction to a more participatory approach and, as Eugene Gendlin (1997:15) phrases it, 'to speak from how we interact bodily in our situation'. It is, however, quite difficult to bypass the subject and object distinction altogether, since we obsessively tend to objectify ourselves, other creatures and events in our concrete situation. The 'more than' is also an attempt to speak beyond the obsessive objectifying of objects, events and each other. It is furthermore an effort to express the notions of sentiment of the flesh and sensitivity to the textures of life. The term 'sensing' endeavours to capture what Gendlin (1996) conveys with the word 'focusing' and Todres (2011:2) defines 'embodied understanding' as 'a form of knowing that evokes the possibility of living, bodily relevant textures and meanings.' He in turn builds upon Gendlin's (1996) notion of focusing, which is about paying attention to the words that work, responding to an experience where language captures the felt sense of word in the body. It is a focus on texture where a phenomenon is not merely a theoretical description but a live moment that was embodied by a person in a concrete situation.

**The living body**

A clearing exists in Kelsey's theological anthropology to incorporate insights from other academic disciplines into the notion of the living body. It also illustrates the necessity of continued interdisciplinary dialogue in the ongoing developing and expanding the notion of the living body. It is therefore necessary to fill this clearing in anthropology with the insights gained from other academic disciplines. These insights include:
An acknowledgement of the species-specific placement of humans in history, and our common creaturehood among primates.

An understanding that the evolution of language is only possible within the context of a sensory-kinetic world.

The notion that sexuality, imagination and morality are intimately linked to the embodied evolutionary nature of humans.

The notion that our moral dimensions are linked to our prehistoric roots, and our moral concepts (for example freedom, compassion, justice, tolerance, and virtue) are structured metaphorically. These moral metaphors ground our bodies and in our social interactions.

The notion that mirror-neurons in the brain provide a strong explanation of how the perception of the emotion in one individual activates neural mechanisms in an observer, allowing the observer to resonate with (empathy) the individual being observed. Interpersonal neurobiology (IPNB) indicates how attachment are shaped by the processes of neural systems and these attachments shape neural patterning.

The notion that the body can also be referred to as a system of 'meaning-seeking', which constantly interacts with its environment in an effort to seek coherence.

The notion that the body is always consciousness embodied, meaning that the embodied mind and human cognition is not only driven by the experiences of the body, but also the crucial role of the body in providing resources for cognition.

The notion that body image and body schema or the later concept of corporal-kinetic intentionality and corporal-kinetic patterning are aspects of the 'meaning-seeking body'.

The notion that the whole body stores memory, including traumatic events, which research in molecular biology has found can be inherited from previous generations.

An acknowledgement of the fundamental importance of touch for the physical, emotional, social and cognitive experiences of humans, that is, the expression of tactile interaction is essential for the developing brain.

The notion that bodymind therapies can create an awareness of the intricate relationship between the body and its lifeworlds, and open us up to the wisdom of our embodiment, and a sense of belonging with our bodies, that is, to be the bodies that we are. The body, therefore, can never merely be a vessel for the disembodied mind.

Kelsey further develops the notion of the living body into the 'personal body' and 'flourishing body'. He includes, for example, the notion of the vulnerable body when speaking of sin, and how people carry traumatic memories in their bodies, also from generation to generation. It is from this deeper interdisciplinary enquiry into the body that it is possible to reconstruct and reform certain doctrines (Meiring 2014:288).

Language

It is clear from the exploration of the corporeal-linguistic turn that there exists a very close relationship between language and experience; it is sometimes a difficult and forced exercise to discuss these in isolation. Keenly aware of the importance of language in wisdom literature and the normative connection between language and complex practices, Kelsey views language as the social, intentional, bodied enactor of complex practices. He views humans as the social, intentional, bodied enactors of complex practices. Language is then an integral part of wise practices in which it is used in such a way that the nature and purpose of the relevant practice, and responds to the realities of the larger public context. According to Kelsey (2009:199), it is very important that language is not in a way that is false or deceitful, since distorting the use of language is to deform the quotidian created by God. He also acknowledges the interconnectedness of body and its capacity for language, and the way in which language is intimately connected to a culture and its images (Meiring 2014:288).
A contemporary theological anthropology that takes the body seriously should also incorporate the insights from paleoanthropology and linguistic philosophy with regard to the role of language and the intimate connection between the body and experiencing. The ability to walk upright is the defining moment in hominid evolutionary history, signals and language developed from this and, in turn, the human brain has been reorganised in response. Linguistic philosophy has focused the attention on the challenge in languaging human experiences, and the effort it takes to stay true to the truth of experiences through the use of language. The living body is part of language as Gendlin (1997:28) expresses in his assertion that 'speaking is a special case of bodily interaction.' The body has an implicit knowing function that includes knowing the language, and how it is relevant to a kind of bodily knowing (which includes language) is about a living body continuously interacting with the living body, which makes the assertion that the living body is its own next step, that 'a living body process' in the sense that it implies its next bit of life process. The challenge is to move beyond the subject and object distinction and to speak from how we interact bodily in a specific situation, trying to express the bodily experience in a concrete lifeworld, speaking from a 'sensed experience.'

**Experiencing in a concrete lifeworld**

A second clearing that exists in Kelsey's (2009) theological anthropology and in other contemporary theological anthropologies, is the lack of recognition of experience as a source of revelation and knowledge. Body theology, under the influence of liberation theology has brought this crucial aspect to the fore. Nelson (2004) views human experience as important theological data in contemplating the reality of God, and describes it as the 'first moment' and the 'second moment'. If theology or theological anthropology as 'second moment' should incorporate body experiences as important theological data, the way in which we listen to the 'voice' of the body would be the challenge. It is not only about accumulating facts about the body, and what happens to the body under certain circumstances, but also how to access these experiences, and how to language these experiences words or concepts or doctrines. It is easier to make theological statements on how to live in the body, and from there reflect about human existence and the reality of God. The challenge in the latter position is to make theological judgements and statements aside and to listen to interior dynamics of human bodily experience as a 'sense-making process' (Meiring 2014:290).

Theological anthropology as embodied sensing endeavours to capture this process of sense-making as an authoritative source of revelation and knowledge on par with tradition and scripture. Eugene Gendlin (1997) asserts that 'experiencing is inherently sense-making', and that sense-making is implicitly symbolised in the interactional human and non-human creatures. These events are then elaborated through language which Gendlin (1997) concludes is that there can be no sense-making without experiencing and eventing, and in the context of argumentation there can be no sense-making of existence before God without experiencing and event experience through language. And if all experiences are grounded in the body, the intimate and intricate texture of the living body, experience, and language is uncovered and it is within this intimate relationship that theological anthropology as 'second moment' develops its enquiries and articulations.

Theological anthropology as embodied sensing should also be aware that not all bodily experiences can be captured in the cognitive units of theological language, that some experiences could probably never be expressed in language, and that they could only be 'sensed' through further living. Todres (2011:20) expresses that all experiences by referring to the body in its lifeworld 'as the messenger of the unsaid'. Gendlin refers to the 'felt sense' of bodily experiences, whereby he not only expresses the feeling of 'the stuff inside', but 'the sense of happening in one's living in the outside' (Gendlin 1997 cited in Todres 2011:23). The challenge for a contemporary anthropology as embodied sensing is to capture this embodied experiencing, the 'felt sense' of bodily language to the 'unsaid' of the body. Then theological anthropology as embodied sensing truly has a sensitivity to the textures of life (Meiring 2014:291).

**The 'more than'**
The 'more than' can refer to a variety of ideas or concepts, or theological thought experiments and articulations that refers to the 'epistemic mysteriousness' of living human bodies, that not all manner of knowing of the exhausted, and that the 'Trinitarian formula of humans being created by 'the Father through the Son' g in the very life of God' (Kelsey 2009:268). Living human bodies are amazingly complex and in this sense 'inexhaustible objects of knowledge.' This ties in with what Todres describes as 'the unsaid' of the human experience of knowing that not all human bodily experiences can be linguaged. Todres (2011:185) also expresses the 'unsaid experiences of spirituality in everyday life' are grounded by the palpable lived experience of meeting the excess of the known.' His concept of the living body is that it is not merely an object encapsulated by skin, but that it is a 'more than' to the lived experience of meeting a mystery that is always in the excess of the known.

There is a 'more than' to the eventing of human bodily experiences in a concrete lifeworld; there is a 'more than' to the sensory and textured bodily life that cannot easily be conveyed into theological articulations. Kelsey (2009:544) refers to the notion of eccentric existence, and the continuity between physical human bodies and glorified bodies, living 'in the sociality of community-in-communion' where they are recognisable as individuals with dignity and unqualified respect. Kelsey (2009:550) describes Jesus Christ as 'uniquely God-related', and 'the image of God' that humans are finite living mysteries that image the triune living mystery.

Kelsey (2009:546) writes that there is a discontinuity in the 'mode of bodiliness' of the pre- and post-Easter Jesus. He continues that Paul writes in 1 Corinthians 15:50 that 'flesh and blood cannot inherit the kingdom of God', meaning that only a glorified body can inherit the kingdom of God. The resurrection into his previous, physical body 'tied to quotidian space, time and matter', but is raised 'in God's eschatological future' as a mark of 'the proleptic intrusion of the eschatological reign of God into quotidian proximate contexts' (Kelsey 2009:546). He continues to draw two implications for theological anthropology. The first is that the resurrected body of Jesus should not be confused with a resuscitated body (like those of Jairus' daughter or the widow's son in Nain or Lazarus). They are considered as resuscitations that should not be confused with a resuscitated body (like those of Jairus' daughter or the widow's son in Nain or Lazarus). They are considered as resuscitations and do not have 'the significar way in which God inaugurates fulfillment of eschatological blessing.' The second implication is that 'bodies transfigured or glorified bodies are social and communal. The adopted human brothers in the same eschatological consummation since the 'fulfilment of God's promise of eschatological blessing' in the bodily resurrection of Jesus. Jesus is resurrected in and with community (Kelsey 2009:550), which writes that there is sufficient discontinuity to ascertain that 'the new creation is not just the old.' Kelsey (2009:550) continues that the 'more' is also captured by the otherness of the new creation, 'justice, peace and love that characterize the community-in-intimate-communion that constitutes the living human personal body, identified with the pre-Easter Jesus, who is encountered post-Easter as a transfigured or glorified body that is in important ways discontinuous with the pre-Easter Jesus.

He continues that Paul writes in 1 Corinthians 15:50 that 'flesh and blood cannot inherit the kingdom of God', meaning that only a glorified body can inherit the kingdom of God. The resurrection into his previous, physical body 'tied to quotidian space, time and matter', but is raised 'in God's eschatological future' as a mark of 'the proleptic intrusion of the eschatological reign of God into quotidian proximate contexts' (Kelsey 2009:546). He continues to draw two implications for theological anthropology. The first is that the resurrected body of Jesus should not be confused with a resuscitated body (like those of Jairus' daughter or the widow's son in Nain or Lazarus). They are considered as resuscitations and do not have 'the significar way in which God inaugurates fulfillment of eschatological blessing.' The second implication is that 'bodies transfigured or glorified bodies are social and communal. The adopted human brothers in the same eschatological consummation since the 'fulfilment of God's promise of eschatological blessing' in the bodily resurrection of Jesus. Jesus is resurrected in and with community (Kelsey 2009:550), which writes that there is sufficient discontinuity to ascertain that 'the new creation is not just the old.' Kelsey (2009:550) continues that the 'more' is also captured by the otherness of the new creation, 'justice, peace and love that characterize the community-in-intimate-communion that constitutes the living human personal body, identified with the pre-Easter Jesus, who is encountered post-Easter as a transfigured or glorified body that is in important ways discontinuous with the pre-Easter Jesus.

Even though Kelsey (2009:552) admits that there are 'virtually no grounds' for proposals with descriptive human bodily life and its proximate context without bordering on 'fantasy pictures' of life in promoting various forms of piety, he nevertheless puts forth proposals about the 'fully actualized eschatological consummation of human personal bodies in community' (Kelsey 2009:553). He bases his concept on Christian beliefs with an effort to 'steer imaginative speculation away from the more misleading and dangerous fantasies' (p. 553). He formulates his concept at the intersection of descriptions of an actual living human personal body and minimal conditions that should be met according to evolutionary biology of what constitutes 'life', the continuity and discontinuity among theological claims, and being guided by the 'dialectic between the continuity and discontinuity and pre-Easter Jesus.'

Exploring embodied sensing through bodymapping
One of the ways in which I have endeavoured to uncover the intimate and intricate connection between experience, and language as well as the 'more than' ('the mystery of unsaid'), is through the use of bodymapping in narrative therapy. The challenge lies in languaging human experiences, and the effort it takes to stay true to the truth of experiences through the use of language; to find the words that work.

The motivation for me as a narrative theologian and therapist is to listen to the stories of people as expressed through their bodies. Jane Solomon (2007:2-3) describes bodymapping as a way of telling stories and making art about a person and her life (Figure 2).
The Memory Box Project at the University of Cape Town started running Memory Box workshops in Khayelitsha in 2002 (Bodymaps n.d.). Memory work is used with people with HIV and AIDS helping them to prepare for their own deaths and leaving their story behind for their children. In these workshops, facilitators discovered that people undergoing antiretroviral therapy (ART) treatment, were more future orientated than looking at the past. A large group of people had to draw their life stories, hoping to live longer. Flowing from this discovery, Jonathan Morgan and Jane Solomon developed the bodymapping process which resulted in the writing of the 'Living with X' a bodymapping facilitator’s manual (Meiring 2010:4 of 7).

The suggestion was made that the bodymapping process could have other applications for example, people with eating disorders or people living with chronic pain (Brett-MacLean 2009:741). It made me very curious to explore the possibility of using bodymapping in my work as narrative theologian. Another research project was centred on the question of how people make sense of physical trauma through their experience of bodymapping (Meyburgh 2006:6).

The notion of body memory refers to:

[All the implicit knowledge, capacities and dispositions that structure and guide our everyday being-in-the-world without the need to deliberately think of how we do something, to explicitly remember what we did, or to anticipate what we want to do. (Koch, Caldwell & Fuchs 2013:82)]

This kind of knowledge is accumulated 'in the course of our embodied experiences', especially in early childhood, and is then transformed throughout our life. There are six forms of body memory, including habitual body memory (habitual memory which enables us to acquire sensorimotor skills); situational body memory (atmospheric memory and the memory of interior and exterior spaces); inter-corporeal body memory (a bodily knowing of how to deal with others); incorporative body memory (the adaption of poses, manners and gender roles based on family cultural environments); pain memory (the impact on physical painful experiences on the present moment); and traumatic memory (the impact of traumatic experiences on the present) which is stored in the body (Koch et al. 2013).

In her work on bodymapping, Meyburgh (2006) cites the geneticist and professor in biophysics, Mae-Wan Ho, writing:

There is no doubt that a body consciousness exists prior to the 'brain' consciousness associated with the nervous system. The body consciousness has also a memory. The relevant transmission system is called proton jump-conduction which belongs to a form of semi-conduction in condensed matter, and is much faster than conduction of electrical signals by the nerves. Thus the 'ground substance' of the entire body has a much better intercommunication system than can be provided by the nervous system alone. (p. 13)

I have recently encountered the work of the neuroscientist Antonio Damasio, who also uses the term 'bodymapping' in his research. He employs it as a term to describe the process in which the body interacts with its environment and how changes caused in the body by this interaction are mapped in the brain (Damasio 2012:91). He continues that 'world external to the body can come into the brain only via the body itself, namely via its surface' (Damasio original). The body employs a variety of signals (chemical and neural) to send messages to the brain.
communication can be mapped very simply for example, by the mapping of the position of a limb in space, but a significant part of this signalling is initially channelled via the spinal cord and brain stem (Damasio 2012:92). He function and physical structure of the body are engraved in brain circuitry meaning that 'some version permanently re-created in brain activity' (Damasio 2012:93). It would be a fascinating topic for future research to explore to-body signalling (Damasio’s bodymapping) with bodymapping as a narrative tool combined with theological anthropology as embodied sensing.

**Impressions from the body maps of co-researchers and clients**

Flowing from the use of bodymapping as a narrative tool during research and counselling, I have the following impressions:

- A dominant theme which surfaced was around acceptance and rejection, connected to concepts resulting in strong feelings of guilt, especially regarding sexuality and bodiliness. This in turn manifested in the way of eating disorders, stress, sexually alienating behaviour and dissociation from the body.

- Experiences of rejection were also linked to extremely dominant metadiscourses of what it means to be a good wife, a pretty woman, an attractive man, the typical male. The language of these metadiscourses that of a patriarchal heterosexism. My impression was that it causes a lot of anxiety and confusion regarding personal identity. These same patriarchal heterosexist metadiscourses had an almost unbreakable hold on clients’ image of God as purely male.

- Isherwood and Stuart (1998:96) write about the epistemology of the flesh as body knowledge. Bodymapping can give voice to, for example, stories of oppression. The bodymapping process metaphors and symbolism and ties in beautifully with the concept of externalisation in narrative therapy.

- Bodymapping is a powerful medium to create awareness regarding dominant metadiscourses I used to facilitate a process of body integration, overcoming various forms of oppression.

- Bodymapping could assist in the body and spiritual integration (Meiring & Müller 2010:6 of 7).

**Concluding remarks**

The body matters. The history of South Africa and the African continent is rich in narratives of how bodies have been abused, but were also used as a ‘site of resistance’ against various forms of oppression, discrimination and alienation. The relationship between the living body, language, experiencing in a concrete lifeworld and the ‘more than’ as expressed in the notion of theological anthropology as ‘embodied sensing’, is more complex than the incorporation of secondary theology in the process of reformulating doctrines in a theoretical and cognitive fashion with primary theology, for example moral theology or Christian ethics. It is about the sensing (feeling, thinking, meaning-making) of words about God (scripture, doctrines and tradition), and how it resonates with a lived body in a concrete lifeworld in turn informing the speaking of words about God (interpretation of scripture and tradition in doctrines). It is an ongoing process of embodying theology and theologising (from) the body making enquiries within theological anthropology about the embodied existence of human and non-human God (Meiring 2014:284).
